

To get your Veichi VSD drive for pumps online and connected, follow these simple steps:

1. Check MTN Signal at the Installation Site

Before purchasing any equipment, ensure that your installation site has a strong and stable MTN signal. The Veichi IoT (GPRS) module relies on the MTN network for communication, so reliable coverage is essential for proper operation and remote monitoring.

2. Purchase the Veichi VSD Drive and IoT (GPRS) Module

Once you've confirmed MTN signal availability, purchase the following together:

- Veichi VSD Drive – The main controller for your pump system.
- IoT (GPRS) Module – Enables the VSD drive to connect to the internet for remote monitoring and data communication.

3. Purchase the Veichi Data Package from CEDAR

We offer an 18-month prepaid data package for R1100 (ex VAT).

This package:

- Covers all data usage for the full 18-month period.
- Removes the need for monthly top-ups or SIM management.
- Provides uninterrupted connectivity for your IoT module.

4. Provide Your Details for Setup

Before we configure your unit, please send us the following information to create your Veichi user profile and connect your VSD drive to the Veichi monitoring app:

- Full name (first and last)
- Email address

Once your profile is created, your device can be linked and tested for remote access through the Veichi app.

5. SIM Module Installation and Testing

After we've received your details and confirmed your purchases:

- We'll install and configure the SIM card in your Veichi VSD drive.
- The system will be tested to verify connectivity and online functionality before being shipped to you.

Important Notes

Remote Control Features: You will be able to remotely start or stop the pump with the VSD drive using this setup and view performance data of the system.

Save Time on Installation: By completing this pre-setup process, you'll save significant time during installation. We'll make sure everything is ready before the unit arrives on-site.
